Typical measurement accuracy vs. ambient temperature & temperature of measurement object

Condition:

frame rate: 1fps moving average: Yes Typical measurement accuracy vs. ambient temperature & temperature of measurement object after calibration of the pixels.

The calibration just can be done by customer. If customer adjust each pixel's output within the software the accuracy between the pixels can be increased like shown in the diagram.

#### Example:

All pixes does see a heat source of 35.0  $^{\circ}$  C. Customer an adjust the output to become 35.0  $^{\circ}$  C for all pixels.

Before)

Pixel 1; 34.5  $^{\circ}$  C

Pixel 2; 35.25° C

Pixel 3; 36.75 ° C...

Adjustment by software)

Pixel 1; +0.5 ° C

Pixel 2: -0.25 ° C

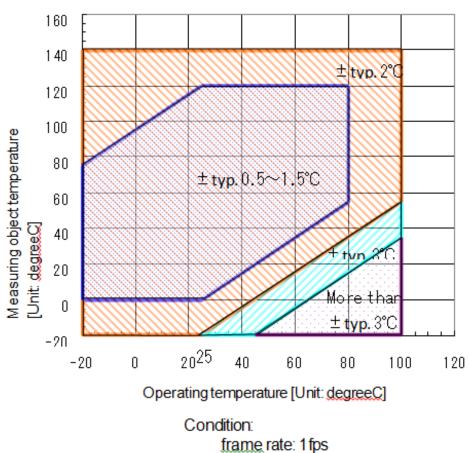

Pixel 3; -1.75 ° C ...

After)

Pixel 1; 35.0 ° C

Pixel 2; 35.0° C

Pixel 3; 35.0° C

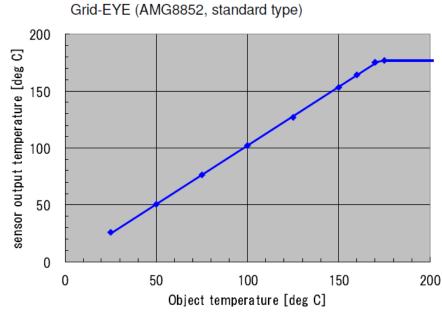

moving average: Yes

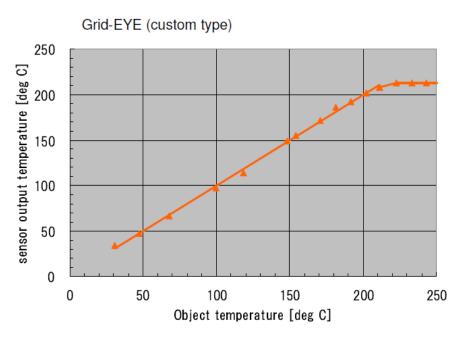

Standard type Grid-EYE (AMG8852, low gain type) saturates when object temperature exceeds 170 degreeC. By lowering gain amplification in IC, Grid-EYE (custom type) can detect the object which is higher than 200degreeC.

When gain amplification is set up low, a noise increases relatively, and the accuracy gets worse.

The accuracy and object temperature range expansion have a relation of trade-off.

\*Ambient temperature is 25 degC

\*Ambient temperature is 25 degC

### Moving Average Register

### Average Register

Register for setting moving average Output Mode.

bit5: MAMOD

1: Twice moving average Output Mode

address	registe r	R/W	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	Initial value
0x07	AVE	R/W	ı	ı	MAMO D	ı	I	ı	ı	ı	0x00

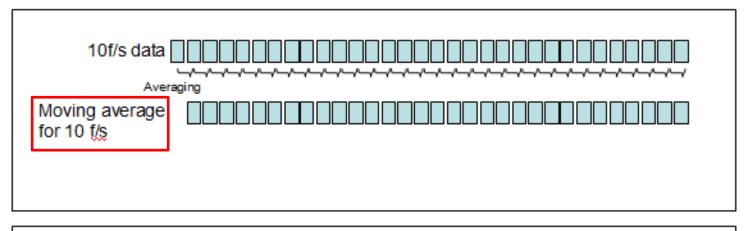

Noise will decrease to 1/sqrt2 by using moving average function.

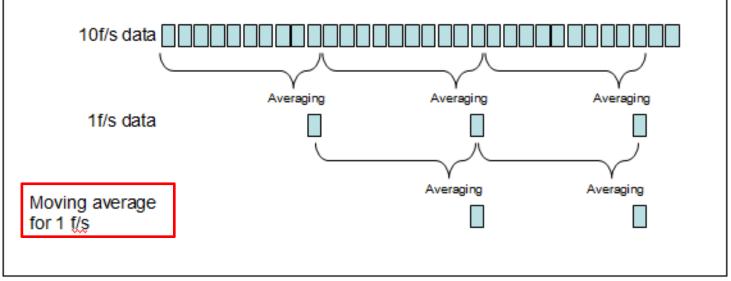

$$V_o(t) = \{V_{out}(t) + V_{out}(t-1)\}/2$$

 $V_{out}(t)$  output data

 $V_o(t-1)$  moving average data

## **How Moving Average Works**

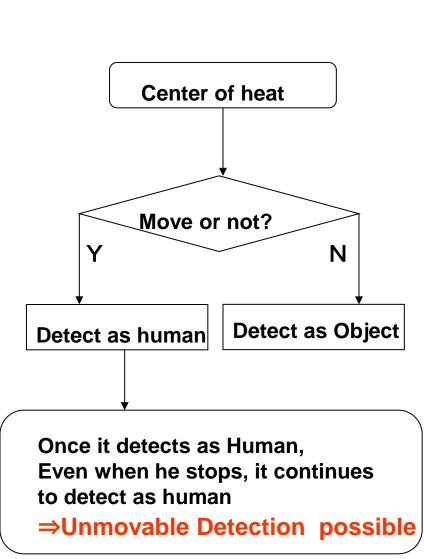

#### Example pixel size vs. distance vs. object size

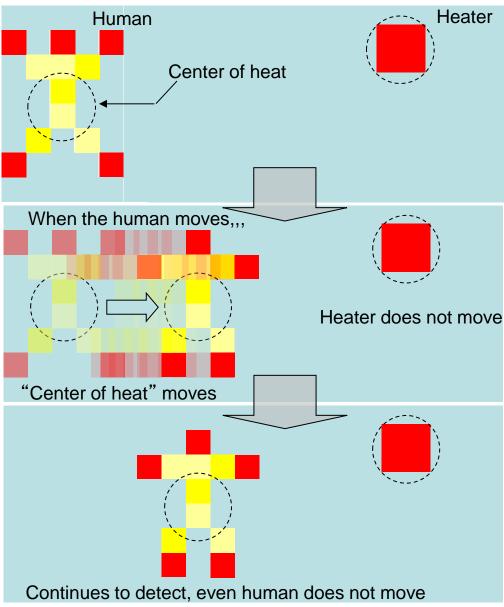

Ambient temperature =  $25^{\circ}$ C

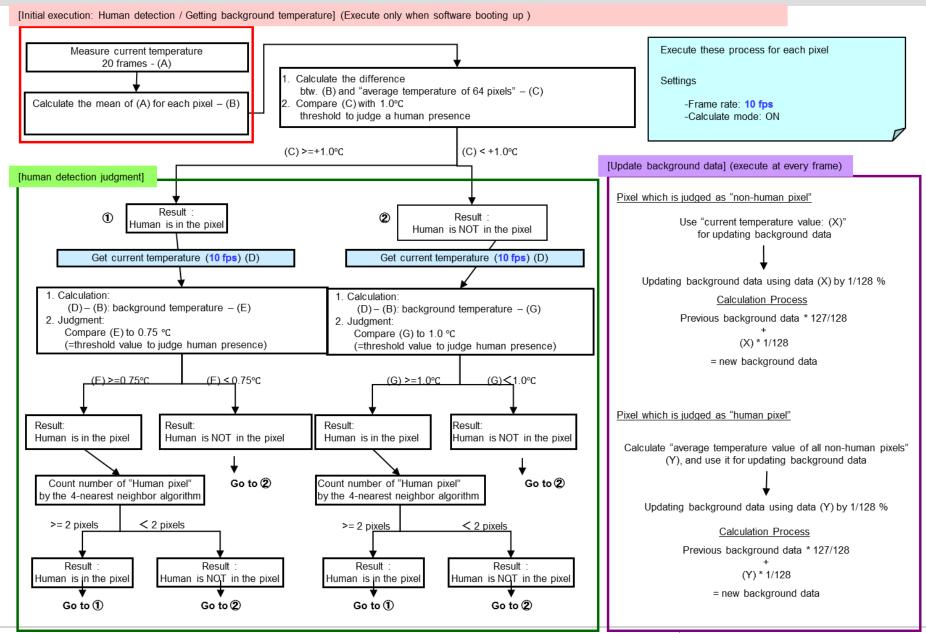

Temperature of measurement object =  $34^{\circ}$ C  $\Delta T$  =  $9^{\circ}$ C  $\Delta T * 70\% (@5m)$  =  $6.3^{\circ}$ C  $\Rightarrow$  Measured value =  $25^{\circ}$ C +  $6.3^{\circ}$ C =  $31.3^{\circ}$ C

#### Thermal Human Detection

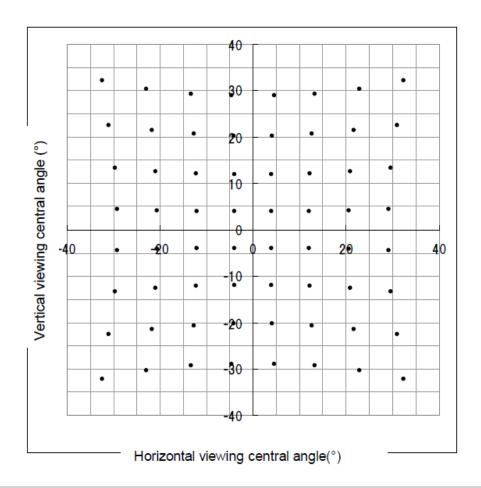

### Flowchart Human Detection with Background Subtraction

(3) Typical characteristics: Each pixel's viewing central angle \*Regarding of Pixel Array, please refer to 4-7(1).

Sensor's optical center (the origin of graph below) gap : within Typ.  $\pm 5.6^{\circ}$  (Both of horizontal and vertical directions)

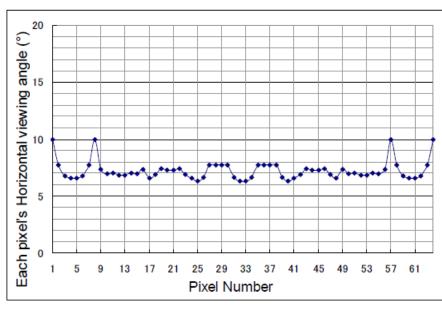

(4) Typical characteristics: Each pixel's viewing angle (half angle)

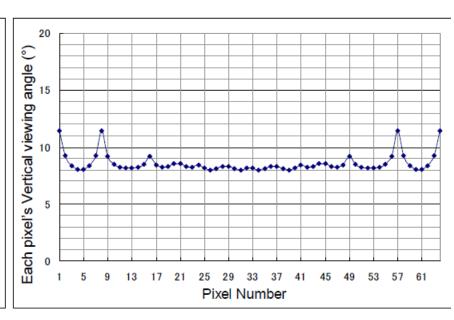

Central 4 pixels (Pixel No. 28, 29, 36, 37) viewing angle (half angle):

horizontal direction Typ. 7.7°

vertical direction Typ. 8°

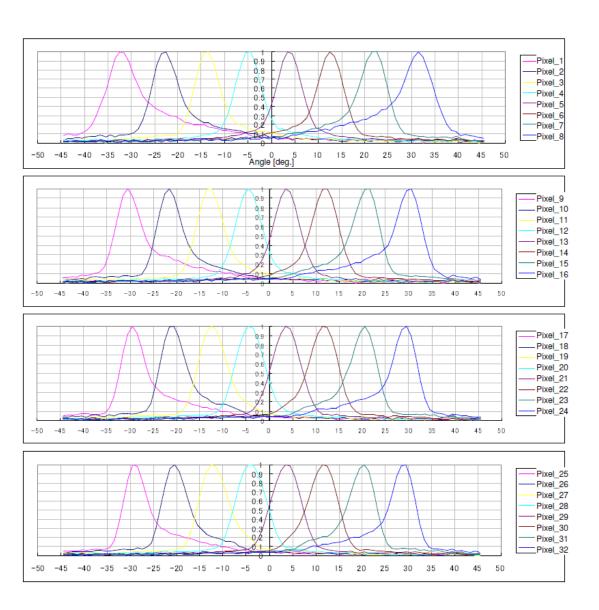

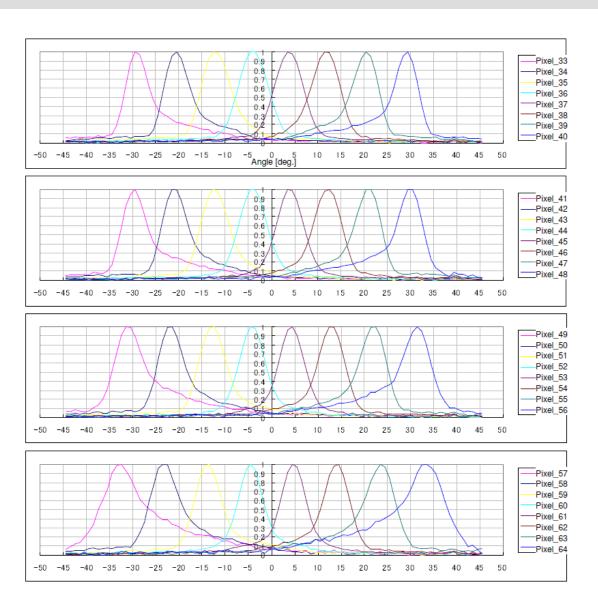

Each pixel's vertical viewing angle

=> Tolerance of FOV is approx.  $3^{\circ}$  . (Typ.60 $\pm 3^{\circ}$ )

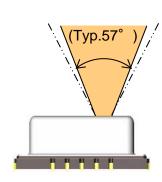

Detection area of each pixels (Typical data)

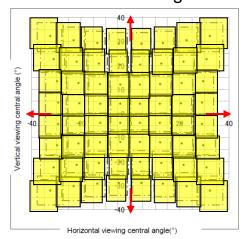

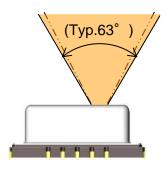

### The case of narrow angle

### The case of wide angle

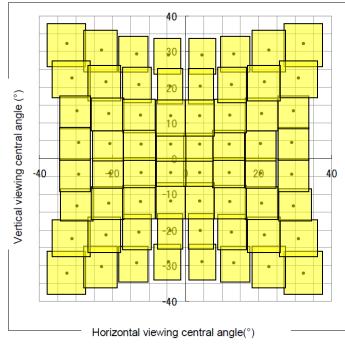

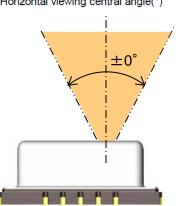

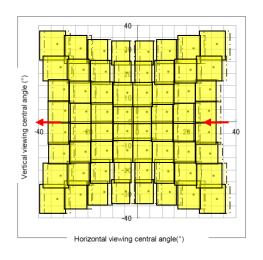

### Optical center gap

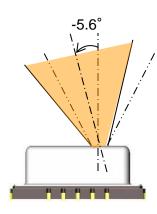

=> Optical center gap is within typ.5.6°.

Detection area of each pixels (Typical data)

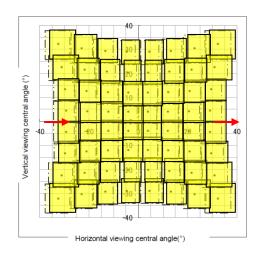

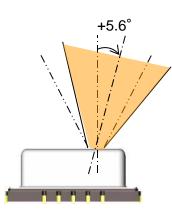

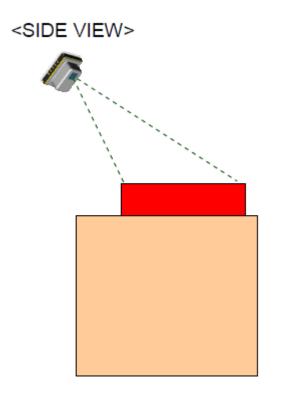

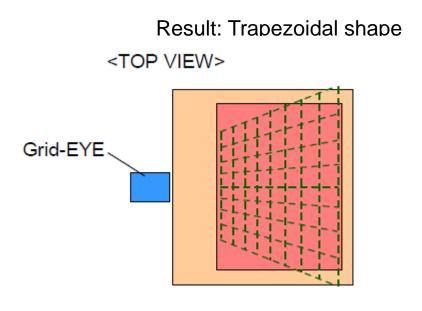

Field of view concept, if Grid-EYE is mounted like following.

→ No rectangular matrix

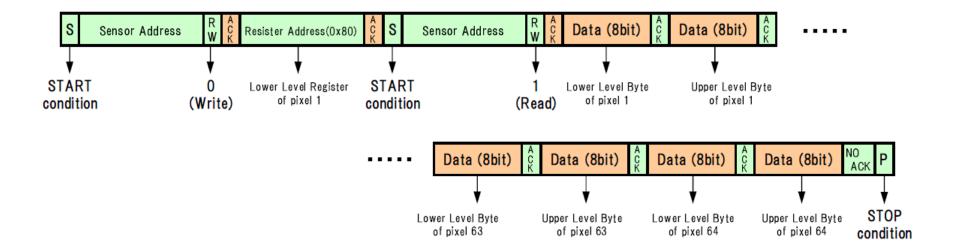

- The emissivity of a material (usually written ε or e) is the relative ability of its surface to emit energy by radiation.
- It is the ratio of energy radiated by a particular material to energy radiated by a black body at the same temperature.
- A true black body would have an  $\varepsilon$  = 1 while any real object would have  $\varepsilon$  < 1. Emissivity is a dimensionless quantity.
  - → Grid-EYEs is adjusted to an ε ≥ 0.93

●How to get data of 64 pixels

: Master(Micro, PC ,etc.)

: Slave(Grid-EYE)

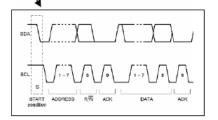

#### **Grid-EYE** communication

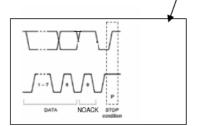

- -1. Master send "Start conditon" to Grid-EYE
  - SCL : High - SDA : Low
- -2. Master send "Sensor address" and "Write" to Grid-EYE on SDA
  - SDA : 11010000 or 11010010 Sensor address Write Sensor address Write
- -3. Master receive "ACK" from Grid-EYE on SDA
- -4. Master send "Register address" to Grid-EYE on SDA
  - SDA: 0x80 ex. Lower Level Register of pixel 1
- -5. Master receive "ACK" from Grid-EYE on SDA
- -6. Master send "Start condition" to Grid-EYE on SDA
  - SCL : High SDA : Low
- -7. Master send "Sensor address" and "Read" to Grid-EYE on SDA
  - SDA : 11010001 or 11010011
    Sensor address Read Sensor address Read
- -8. Master receive "ACK" from Grid-EYE
- -9. Master receive data of Lower Level Byte of pixel1
- -10. Master send "ACK" on SDA

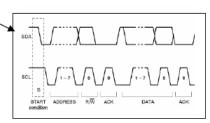

- -11. Master receive data of Upper Level Byte of pixel1
- -12. Master send "ACK" on SDA

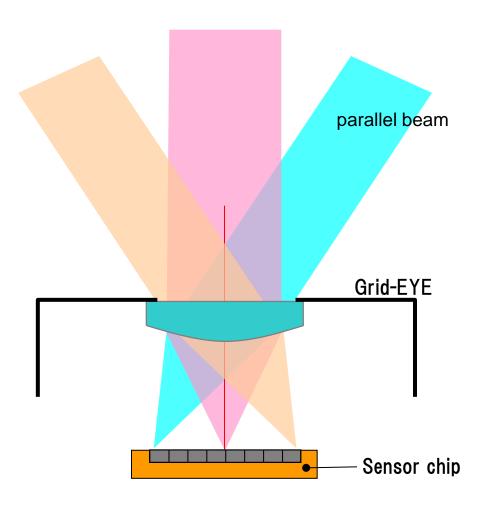

Repetition of 11, 12

- -13. Master receive data of Upper Level Byte of pixel64
- -14. Master send "NOACK" on SDA
- -15. Master send "Stop condition"
  - SCL : High - SDA : High

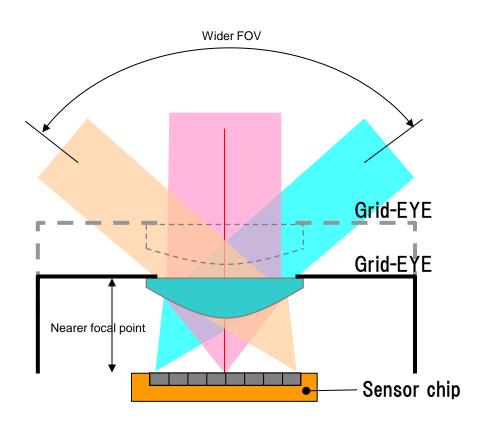

An infrared image is formed on the sensor chip through the Silicon lens.

In the case of Grid-EYE, sensor chip is placed on the focal point.

So only parallel infrared beam can be formed.

If an additional lens is placed in front of the sensor, focal point is changed.

Then infrared image is out of focus.

Wider viewing angle.....

The nearer focal point means wider viewing angle. In this case, Grid-EYE package height and lens shape need to be changed.
